

Energy War

C++ Project

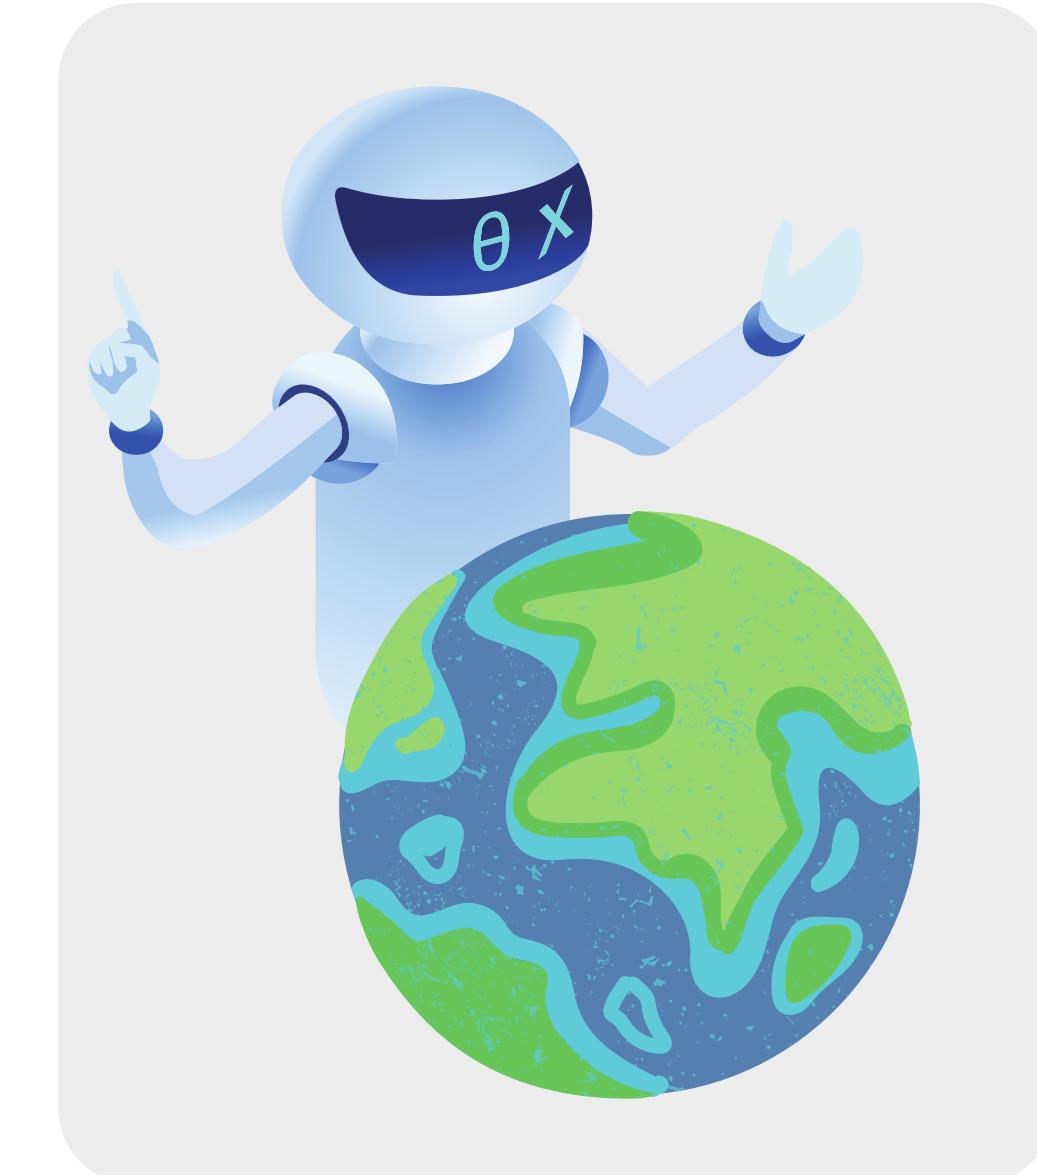

ທີ່ມາແລະຄວາມສໍາຄັນ

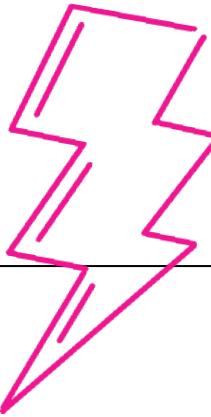

ໂລກໃນປັຈຈຸບັນກຳລັງພັ້ງກາຍດ້ວຍນໍ້າມື່ອຂອງ
ມຸນຸບຍີ່ ມູນຍິນຕີໃນປີ 2099 ຈຶ່ງຢ້ອນເວລາກລັບ
ມາລັງບາງເຫຼຳມຸນຸບຍີ່ເພື່ອໄມ້ໃຫ້ໂລກດູກກຳລາຍ
ໂດຍຈາກທີ່ກ່າວມາ ຈຶ່ງເປັນສາເຫດຸແລະ
ແນວຄົດຫຼັກຂອງເກມທີ່ກຳໃຫ້ສາມາຊັກໃນກລຸ່ມ
ຕັດສິນໃຈກຳເກມແນວ Turn base ອອກມາ
ເນື່ອງຈາກມີຮູບແບບຂອງເກມທີ່ເລັນໄດ້ຈ່າຍ ແລະມີ
ຄວາມນໍາສັນໃຈ ວິກຖິ່ງເນື່ອງຈາກແນວເກມດັ່ງ
ກ່າວ ສາມາດກຳໃຫ້ມີຄວາມຫລາກຫລາຍຂອງ
ໂຄຮງສ້າງກາຣເຢ່ຍນໂປຣແກຣມໄດ້ ນີ້ຈຶ່ງເປັນທີ່ມາ
ແລະຄວາມສໍາຄັນຂອງໂຄຮງງານດັ່ງກ່າວ

● รายละเอียด

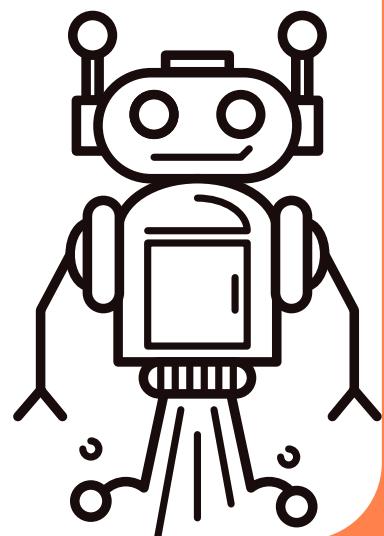

- เกมต่อสู้ Turn-base ที่ต้องเล่นเป็นหุ่นยนต์ต่อสู้กับมนุษย์
- ทุกการกระทำของหุ่นยนต์จะต้องใช้พลังงาน บังเอิญตรงกับรีม ENERGY พอดีเลย
- มีด่านทั้งหมด 5 ด่าน แต่ละด่านก็จะมีจำนวนศัตรูและจำนวนระลอกแตกต่างกัน
- การต่อสู้ในแต่ละระลอกจะถูกแบ่งเป็นเทิร์น
- หุ่นยนต์มีทั้งหมด 3 ชนิด แต่ละชนิดจะมีค่าสถานะที่แตกต่างกัน สามารถทำการโจมตีได้ เมื่อонกันแต่จะมีทักษะพิเศษแตกต่างกัน
- ศัตรูจะมีทั้งหมด 4 ชนิด แต่ละชนิดมีความแตกต่างกันที่รูปร่างหน้าตาและค่าสถานะพลัง
- ค่าสถานะมีทั้งหมด 4 อย่างคือ HP(พลังชีวิต) DEF(พลังป้องกัน) ATK(พลังโจมตี) และ EN(พลังงาน)

●●● ข้อจำกัด

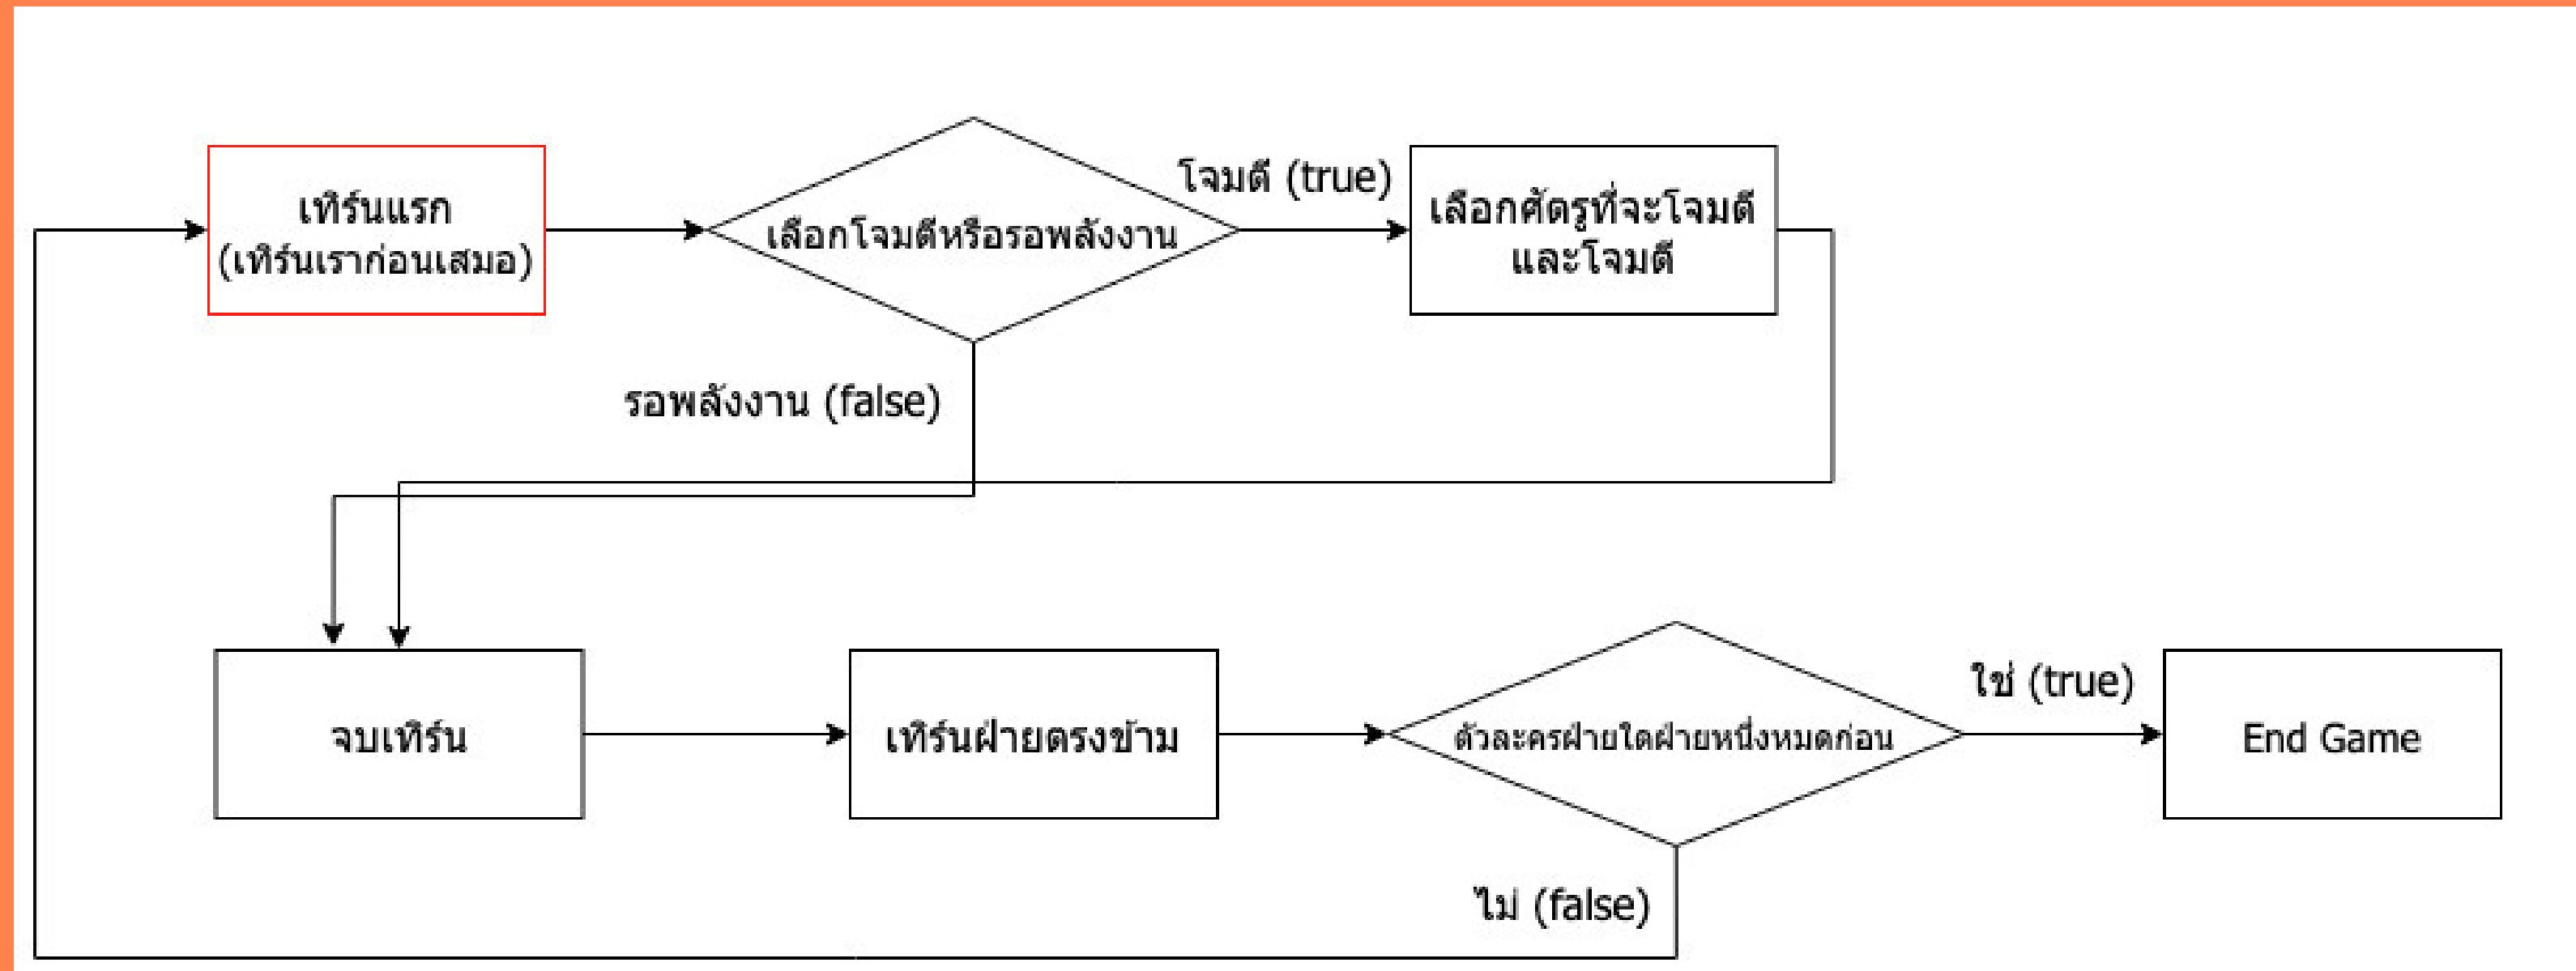

1. การเพิ่มจำนวนหุ่นยนต์ให้มากกว่า 3 ชนิด รวมถึงการแสดงผลหุ่นยนต์บนหน้าจอ
มากกว่า 3 ตัว จะต้องปรับแก้โปรแกรมหลายจุด
2. พวกศัตรูถูกออกแบบมาให้ทำได้แค่โถมตีเท่านั้น หากต้องการให้ศัตรูมีทักษะ^{มากกว่าแค่การโถมตีจะต้องปรับแก้โปรแกรมหลายจุด}
3. การทำงานของโปรแกรม จะต้องสั่งผ่านการใส่ตัวเลขลงไปเท่านั้น
4. หากทำการส่งค่าเข้าไปก่อนที่โปรแกรมจะข้อจะทำให้โปรแกรมทำงานผิดพลาดได้
5. ถ้ากดเริ่มเกมไปแล้วไม่สามารถออกกลางคันได้จนกว่าจะชนะเกมหรือแพ้

●●● Class: Charactor

class character เป็น
คลาสแม่ของ Robot และ
Enemy
กำหนดให้เก็บและแสดงผล
ค่าสถานะต่างๆ คือ
Name, Hp(health
points), Df(defense)
และ Atk(attack)

```
class character : public NODE // mother class
{
protected:
    string name;
    int hp;      // health point
    int max_hp;  // hp สูงสุด
    int atk;     // attack point
    int df;      // defense point
    int cd_1 = 0; // cooldown skill1
    int po = 0;   // position

public:
    character(string n, int a, int c, int d) {
        max_hp = a;
        hp = a;
        df = c;
        atk = d;
        name = n;
    }
    int checkdeath() { //เช็คว่าตายหรือยัง
        if (hp <= 0) {
            return 1;
        } else
            return 0;
    }
    void setpo(int a) { po = a; } //ตั้งตำแหน่งในหน้าจอ
    int getpo() { return po; } //รับค่าตำแหน่ง
    int getcd_1() { return cd_1; }
    void changecd_1(int a) {
        cd_1 = cd_1 + a;
        if (cd_1 < 0) {
            cd_1 = 0;
        }
    }
    string getname() { return name; }
    int gethp() { return hp; }
    int getdf() { return df; }
    int getatk() { return atk; }

    void takedamg(int d) { //เสือลด
        d = d - df;
        hp = hp - d;
        if (hp < 0) {
            hp = 0;
        }
        cout << name << " take " << d << " damage." << endl;
    }
    void takeheal(int d) { //รับฟื้นฟูhp
        if (d + hp > max_hp) {
            d = max_hp - hp;
            hp = max_hp;
        } else
            hp = hp + d;
        cout << name << " was healed " << d << " HP." << endl;
    }
    void show() {
        cout << name << " HP:" << hp << "/" << max_hp << " def: " << df
            << " atk: " << atk << endl;
    }
    string getstat() {
        string a = name + " HP:" + to_string(hp) + "/" + to_string(max_hp) +
                    " def: " + to_string(df) + " atk: " + to_string(atk);
        return a;
    }
    ~character() {}
};
```

●●● Class: Robot

class Robot เป็นคลาส
แม่ของ robot1 robot2
และrobot3 กำหนดที่จัด
เก็บและแสดงผล รวมถึง
คำนวนค่าสถานะพิเศษที่มี
เฉพาะในตัวละครหุ่นยนต์
ซึ่งคือ En (Energy)

```
class Robot : public character //หุ่นยนต์ซึ่งเรา Inheritances class
{
protected:
    int max_en; // enegy สูงสุดที่สามารถเก็บได้
    int en;
    int en_c = 0;
    string type;

public:
    Robot(string n, string t, int h, int e, int d, int a)
        : character(n, h, d, a) {
        max_en = e;
        en = e;
        type = t;
    }
    int attack(void) {
        int attack;
        srand(time(NULL));
        attack = atk;
        this->usedenergy(1);
        cout << "You just attacking on enemy with " << attack
            << " damage.\nUse 1 enegy " << name << " has " << en << " enegy left "
            << endl;
        return attack;
    }
    string gettype() { return type; }
    int geten() { return en; }
    bool check_reenergy(int t) {
        if ((en_c + 1) == t) {
            en_c = 0;
            return true;
        } else {
            en_c = t;
            return false;
        }
    }
    void usedenergy(int x) { en = en - x; }
    void renew_energy() {
        int d = 3;
        if (en + d > max_en) {
            d = max_en - en;
            en = max_en;
        } else {
            en = en + d;
        }
        cout << name << " restored " << d << " enegy." << endl;
        sleep_for(seconds(1));
    }
    ~Robot() {}
};
```

●●● Class: Enemy

class enemy กำหนดให้
เก็บประเภทของศัตรู และ
ใช้สำหรับแสดงผลการ
โจมตีของผู้ต่อสู้

```
class enemy : public character //承繼 //Inherits class from character
{
private:
    string type;
public:
    enemy(string t, string n, int h, int d, int a) : character(n, h, d, a) {
        type = t;
    }
    int attack(void) {
        int attack;
        srand(time(NULL));
        attack = 1 * atk;
        return attack;
    }
    ~enemy() {}
};
```

Class: Node

```
class NODE {  
    NODE *next;  
  
public:  
    NODE();  
    virtual void show() {}  
    void insert(NODE *&);  
    NODE *move_next();  
    virtual int takedamg(int) {}  
    virtual void takeheal(int) {}  
    virtual int checkdeath() {}  
    virtual int attack() {}  
    virtual int skill_1() {}  
    virtual void RobotAction() {}  
    virtual int geten() {}  
    virtual string gettype() {}  
    virtual string getname() {}  
    virtual string getstat() {}  
    virtual int getcd_1() {}  
    virtual int getpo() {}  
    virtual void setpo(int) {}  
    virtual void renew_energy() {}  
    virtual void changecd_1(int) {}  
    virtual string *getnormal() {}  
    virtual string *getshake() {}  
    virtual string *getdeath() {}  
    virtual string *getattack_1() {}  
    virtual string *getattack_2() {}  
    virtual string *getskill(){}  
    virtual string *getreenergy() {}  
    virtual voidgettakedamg(int){}  
    virtual ~NODE();  
};  
  
NODE::NODE() { next = NULL; }  
NODE::~NODE() {}  
NODE *NODE::move_next() { return next; }  
void NODE::insert(NODE *&x) { x->next = this; }
```

●●● Class: LL (Links list)

```
class LL {  
    NODE *hol;  
    int size;  
  
public:  
    void add_node(NODE *&);  
    void show_all();  
    void show_name();  
    void attacked(int, int, screen *);  
    void all_attacked(int, screen *);  
    void healed(int, int, screen *);  
    void checkdeath(screen *);  
    int getsize();  
    string getname();  
    NODE *gethol();  
    void robotaction(LL *, screen *, LL *);  
    void enemyaction(LL *, screen *);  
    void robotscreen(screen *);  
    void enemyscreen(screen *);  
    void datascreen(screen *);  
    void clear();  
    ~LL();  
    LL();  
};
```

```
void LL::robotscreen(screen *S) {  
    NODE *t = hol;  
    int i;  
    for (i = 0; i < size; i++) {  
        t->setpo(i + 1);  
        S->receive(t->getpo(), t->getnormal());  
        S->receive_data(t);  
        t = t->move_next();  
    }  
    S->show();  
}  
  
void LL::enemyscreen(screen *S) {  
    NODE *t = hol;  
    int i;  
    for (i = 0; i < size; i++) {  
        t->setpo(-(i + 1));  
        S->receive(t->getpo(), t->getnormal());  
        S->receive_data(t);  
        t = t->move_next();  
    }  
    S->show();  
}  
  
void LL::datascreen(screen *S) {  
    NODE *t = hol;  
    int i;  
    for (i = 0; i < size; i++) {  
        S->receive_data(t);  
        t = t->move_next();  
    }  
    S->show();  
}
```

                a = 1;  
            } catch (const char *e) {  
                cin.clear();  
                cin.ignore(50, '\n');  
                int H = A->getsize();  
                cout << e << H << endl;  
                sleep_for(seconds(2));  
                system("clear");  
                M->show();  
                a = 1;  
            }  
        } while (a);  
        M->skill(t);  
        A->attacked(t->skill_1(), M);  
    } else if (t->gettype() == "Robot2") {  
        do { // ---> exception  
            cout << "Choose an ally" << endl;  
            this->show_name();  
            cout << "Input: ";  
            a = 0;  
            try {  
                cin >> Choose;  
                if (cin.fail())  
                    throw 4;  
                if (Choose > R->getsize() || Choose <= 0)  
                    throw "input choose be more than 0 and less or equal to ";  
            } catch (int e) {  
                cout << "Input choose be integer" << endl;  
                cin.clear();  
                cin.ignore(50, '\n');  
                sleep_for(seconds(1));  
                system("clear");  
                M->show();  
                a = 1;  
            } catch (const char *e) {  
                cin.clear();  
                cin.ignore(50, '\n');  
                int H = R->getsize();  
                cout << e << H << endl;  
                sleep_for(seconds(2));  
                system("clear");  
                M->show();  
                a = 1;  
            }  
        } while (a);  
        M->skill(t);  
        this->healed(Choose, t->skill_1(), M);  
    } else if (t->gettype() == "Robot3") {  
        M->skill(t);  
        A->all_attacked(t->skill_1(), M);  
    }  
    t->changecd_1(3); //ໃຊ້ສັກລິດຕົກລິດ 2 ເທົ່ານີ້
```

●●● 5. พัฒน์ชัน checkdeath ใน LL

ตรวจสอบว่า
ตัวละครนั้น^{บี้}
ตายหรือยัง^{บี้}
ถ้าไม่ตายแล้ว^{บี้}
ก็ลบออกจาก
ลิ๊งค์ลิส^{บี้}

```
void LL::checkdeath(screen *M) {
    NODE *t = hol;
    NODE *p;
    int S = size;
    int i;
    for (i = 0; i < S; i++) {
        if (t->checkdeath() == 1) {
            M->receive_data(t);
            M->receive(t->getpo(), t->getdeath());
            if (t == hol) {
                hol = t->move_next();
                NODE *temp = t;
                delete temp;
                t = hol;
                size--;
            } else if (t->move_next() != NULL) {
                NODE *temp = t;
                t = t->move_next();
                t->insert(p);
                delete temp;
                size--;
            } else {
                delete t;
                size--;
            }
        } else {
            p = t;
            t = t->move_next();
        }
    }
}
```

```
int checkdeath() { //เช็คว่าตายหรือยัง
    if (hp <= 0) {
        return 1;
    } else
        return 0;
}
```

●●● 6.เข้ามาที่ฟังก์ชัน enemyaction ในคลาส LL

គោរសុំទូលារឹង
ក្នុងបញ្ហា

```
void LL::enemyaction(LL *R, screen *M) {
    M->show();
    if (size == 0) {
        cout << "All enemy dead." << endl;
    } else if (R->size == 0) {
    } else {
        NODE *t = hol;
        int i;
        for (i = 0; i < size; i++) {
            if (R->size > 0) {
                sleep_for(seconds(1));
                srand(time(NULL));
                int robotnum = rand() % R->size + 1;
                int action = 1;
                M->attack(t);
                cout << t->getname() << " attack!!!" << endl;
                sleep_for(seconds(1));
                R->attacked(robotnum, t->attack(), M);
                if (t->move_next() != NULL) {
                    t = t->move_next();
                }
                R->checkdeath(M);
            }
        }
        cout << endl << "END TURN" << endl;
        sleep_for(seconds(2));
    }
}
```

●●● 7.เข้ามาที่ฟังก์ชัน stage2_battle()

มี 2 wave

หลังจากจบ
wave 1
ເລົາງີ່ຈະສົບ
ສົດຮູໃໝ່ຕ່ອ

```
int stage2_battle() // 2 Robot , Wave1(3Human) ,Wave2(1Human,2Fat human)
{
    string a = "0";
    while (a != "1") {
        system("clear");
        cout << "===== STAGE 2 =====" << endl
            << endl;
        cout << stage2() << endl << endl;
        cout << "ENTER 1 TO CONTINUE" << endl;
        cin >> a;
    }
    LL A;
    LL R;
    int i;
    NODE *t;
    NODE *p;
    t = new human("Jerry");
    A.add_node(t);
    t = new human("Evan");
    A.add_node(t);
    t = new human("Tiger");
    A.add_node(t);
    t = new robot2;
    R.add_node(t);
    t = new robot1;
    R.add_node(t);
    screen S;
    S.getstage("STAGE 2");
    S.getwave("WAVE 1");
    R.robotscreen(&S);
    A.enemyscreen(&S);

    if (battle(&A, &R, &S) == 1) {
        cout << "You win." << endl;
        sleep_for(seconds(2));
        S.getwave("WAVE 2");
        t = new human("Gundam");
        A.add_node(t);
        t = new fat_human("Lumie");
        A.add_node(t);
        t = new fat_human("Mark");
        A.add_node(t);
        A.enemyscreen(&S);
        if (battle(&A, &R, &S) == 1) {
            cout << "You win." << endl;
            sleep_for(seconds(2));
            return 1;
        } else {
            cout << "You lose." << endl;
            return 0;
            sleep_for(seconds(3));
        }
    } else {
        cout << "You lose." << endl;
        return 0;
        sleep_for(seconds(3));
    }
}
```

การelman ข้อต้องมี การแสดงผล

C++ Project

●●● 1. เข้ามาที่ class screen

ใน screen จะ
ประกอบไปด้วย
Array ของ
string เพื่อใช้
เก็บค่าการแสดง
ผลแต่ละ
ตำแหน่ง

```
▼ class screen {
private:
    string free = "          ";
    string stage;
    string wave = "          ";
    string turn[2];
    ▼ string po1[6] = {"      ", "      ", "      ", "      ", "      ", "      "};
    ▼ string po2[6] = {"      ", "      ", "      ", "      ", "      ", "      "};
    "};
    ▼ string po3[6] = {"      ", "      ", "      ", "      ", "      ", "      "};
    "};
    ▼ string po_1[6] = {"      ", "      ", "      ", "      ", "      ", "      "};
    ▼ string po_2[6] = {"      ", "      ", "      ", "      ", "      ", "      "};
    ▼ string po_3[6] = {"      ", "      ", "      ", "      ", "      ", "      "};
    string battledata[10];

public:
```

●●● 2. function receive & receive_data

มี function receive เพื่อ
รับค่าการ
แสดงผลใน
แต่ละตำแหน่ง
โดยรับค่ามา
จาก function
ภายนอก

```
47
48 ▼ void screen::receive(int po, string *A) {
49 ▼   switch (po) {
50     case 1:
51       for (int i = 0; i < 5; i++) {
52         po1[i] = *(A + i);
53       }
54       break;
55     case 2:
56       for (int i = 0; i < 5; i++) {
57         po2[i] = *(A + i);
58       }
59       break;
60     case 3:
61       for (int i = 0; i < 5; i++) {
62         po3[i] = *(A + i);
63       }
64       break;
65     case -1:
66       for (int i = 0; i < 5; i++) {
67         po_1[i] = *(A + i);
68       }
69       break;
70     case -2:
71       for (int i = 0; i < 5; i++) {
72         po_2[i] = *(A + i);
73       }
74       break;
75     case -3:
76       for (int i = 0; i < 5; i++) {
77         po_3[i] = *(A + i);
78       }
```

```
▼ void screen::receive_data(NODE *t) {
  int po = t->getpo();
  switch (po) {
    case 1:
      po1[5] = t->getstat();
      break;
    case 2:
      po2[5] = t->getstat();
      break;
    case 3:
      po3[5] = t->getstat();
      break;
    case -1:
      po_1[5] = t->getstat();
      break;
    case -2:
      po_2[5] = t->getstat();
      break;
    case -3:
      po_3[5] = t->getstat();
      break;
  }
```

●●● 3. การแสดงผล function show screen

หลังจากได้รับ
ค่าของแต่ละ
ตำแหน่งมา^ก
เก็บไว้แล้ว

```
void screen::show() {
    system("clear");
    cout << stage << endl << wave << endl;
    for (int i = 0; i < 6; i++) {
        if (i == 5) {
            cout << po1[i] << "      " << po_1[i] << endl;
        } else {
            cout << po1[i] << free << po_1[i] << endl;
        }
    }
    for (int i = 0; i < 6; i++) {
        if (i == 5) {
            cout << po2[i] << "      " << po_2[i] << endl;
        } else {
            cout << po2[i] << free << po_2[i] << endl;
        }
    }
    for (int i = 0; i < 6; i++) {
        if (i == 5) {
            cout << po3[i] << "      " << po_3[i] << endl;
        } else {
            cout << po3[i] << free << po_3[i] << endl;
        }
    }
    cout << endl << turn[0] << endl << turn[1] << endl << endl;
}
```

ในฟังก์ชัน
show() จะ
แสดงผลด้วย
การพิมพ์
แต่ละตำแหน่ง
โดยใช้ **for
loop**

●●● 4. ประยุกต์การแสดงผล

จะเห็นว่าจะใช้receiveรับค่าแสดงผลในแต่ละตำแหน่งมาและใช้show()

```
void screen::shake(NODE *t) {
    int po = t->getpo();
    sleep_for(milliseconds(350));
    this->receive(po, t->getshake());
    this->receive_data(t);
    this->show();
    sleep_for(milliseconds(450));
    this->receive(po, t->getnormal());
    this->show();
}

void screen::attack(NODE *t) {
    int po = t->getpo();
    this->receive(po, t->getattack_1());
    this->receive_data(t);
    this->show();
    sleep_for(milliseconds(250));
    this->receive(po, t->getattack_2());
    this->show();
    sleep_for(milliseconds(650));
    this->receive(po, t->getnormal());
    this->show();
}

void screen::skill(NODE *t) {
    int po = t->getpo();
    this->receive(po, t->getskill());
    this->receive_data(t);
    this->show();
    sleep_for(milliseconds(1000));
    this->receive(po, t->getnormal());
    this->show();
}
```

ใช้ในการเปลี่ยนท่าทางของแต่ละตำแหน่งได้ และใช้กับfunction sleep_for เพื่อเพิ่มมิติให้กับการแสดงผล

●●● Exception Handling

ดักข้อผิดพลาดจากการรับค่า (cin) แบบทุกจุดในโปรแกรม

```
int b;
do {
    int menu;
    system("clear"); // clear screen
    openwindow();
    cout << "--> 1 START GAME <--" << endl;
    cout << "--> 2 HOW TO PLAY <--" << endl;
    cout << "--> 3 ABOUT US <--" << endl;
    cout << "--> 4 EXIT <--" << endl;
    cout << "======" << endl;
    b = 0;
    try {
        cin >> menu;
        if (cin.fail())
            throw "Invalid input";
        if (menu > 4 || menu < 1)
            throw "Wrong number please try again";
    } catch (int e) {
        cout << e << endl;
        cin.clear();
        cin.ignore(50, '\n');
        sleep_for(seconds(1));
        system("clear");
        b = 1;
    } catch (const char *e) {
        cout << e << endl;
        cin.clear();
        cin.ignore(50, '\n');
        sleep_for(seconds(2));
        system("clear");
        b = 1;
    }
}
```

```
int RA = 0;
do {
    a = 0;
    try {
        t->RobotAction();
        cout << "Input: ";
        cin >> RA;
        if (cin.fail())
            throw 4;
        if (RA > 2 || RA < 0)
            throw "input choose be more or equal to 0 and less or equal to 2";
        if (RA == 2 && t->getcd_1() > 0) {
            cout << "This skill is not ready.\nWait " << t->getcd_1()
                << " turn.";
            throw " ";
        }
        if (RA == 2 && t->geten() < 3)
            throw "Energy isn't enough.";
    }
    catch (int e) {
        cout << "Invalid input " << endl;
        cin.clear();
        cin.ignore(50, '\n');
        sleep_for(seconds(1));
        system("clear");
        M->show();
        a = 1;
    }
    catch (const char *e) {
        cout << e << endl;
        cin.clear();
        cin.ignore(50, '\n');
        sleep_for(seconds(2));
        system("clear");
        M->show();
        a = 1;
    }
} while (a);
```
